A Cargill Deicing Technology Product

Your question:

Does your brine contain any fracking wastewater?

My answer:

No, none of our deicing brines contain fracking waste water. We offer deicing brines that are recovered from our salt mines and salt production facilities. We also sell brine makers which customers use to make their own deicing brines from rock salt. Typically these will be made with regular municipal water, though some agencies will recycle the water used to wash their salt trucks to make brine. I don't know offhand if any agencies are using fracking waste water to make deicing brines.

Providing customers with deicing solutions that save lives, enhance commerce and reduce environmental impact.
