

THANK YOU FOR SUBMITTING YOUR QUESTION...

Your question:

I have picked up a new account for liquid deicing. This is new construction, new asphalt. Any concerns about applying liquid deicer to new asphalt?

My answer:

The commonly used chloride deicers typically do not harm asphalt so there is no need for concern in applying a chloride based liquid deicer to asphalt pavement. Concrete, on the other hand, can be damaged by deicers if it is new and has not had sufficient time to cure.

Providing customers with deicing solutions that save lives, enhance commerce and reduce environmental impact.
